

Roberts Intellectual Property - Patent Infringement

Plaintiff InnovateTech Corporation brings this patent infringement action against defendant TechSolutions Inc., alleging infringement of U.S. Patent No. 10,123,456 entitled "Method and System for Data Processing." The patent covers a novel algorithm for processing large datasets efficiently. The plaintiff alleges the defendant's product, DataPro 5.0, incorporates the patented technology without authorization. The plaintiff seeks injunctive relief, damages for past infringement, and enhanced damages for willful infringement. The plaintiff presented evidence of the defendant's knowledge of the patent and deliberate copying. The defendant denies infringement and asserts the patent is invalid due to prior art and lack of non-obviousness. The defendant presented evidence of similar algorithms published before the patent filing date. Alternatively, the defendant argues its product does not practice all elements of the claimed invention. After claim construction and review of expert testimony, the court finds the patent valid and infringed by the defendant's product. However, the court finds the infringement was not willful, as the defendant had a reasonable basis to believe the patent was invalid. The court awards the plaintiff damages based on a reasonable royalty and enjoins the defendant from further infringement. Enhanced damages are denied.
